	1. Adding to the Existing List or Expanding the Scope of Impairment to a Previously Listed Water	16
	2. Deleting from the Existing List or Decreasing the Scope of Impairment to a Previously Listed Water	16
	3. Prioritization of Waters for TMDL Development	16
	4. Resolution of Interstate/International Disagreements.....	17

I. Citation and Requirements

A. Citation of Section of Clean Water Act

This document is required by revisions of rules under the federal Clean Water Act, Section 303(d), 40 CFR 130.7 and the timetable for presenting the finished document to EPA and the public is given in part 130.10. Section 303(d) requires states to list certain impaired waters and the rules require a document describing how this list will be constructed.

B. USEPA Guidance

In July 2002, the US Environmental Protection Agency issued new guidance, the Consolidated Assessment and Listing Methodology (CALM) guidance that gives further instructions about listing of 303(d) and other waters. In July 2003, USEPA published “Guidance for 2004 Assessment, Listing and Reporting Requirements Pursuant to Sections 303(d) and 305(b) of the Clean Water Act (CWA).”

The entity responsible for administration of the federal Clean Water Act, which in Missouri is the Missouri Department of Natural Resources (the department), should write a draft of a document explaining how the state’s 303(d) list will be constructed. This draft document must be made available by the department to the public for at least a 60-day public review and comment period. The department must provide the USEPA with a document summarizing all comments received and department “*responses to significant comments.*”

The guidelines further recommend that the following specific information be included in the Methodology Document: a) a listing of all the procedures and methods used to collect water quality data; b) the identification of all the types of data that are considered as “all existing and readily available” data; c) what considerations will be made for data age or data quality; d) how water quality data is used to determine if a stream or lake is impaired; e) by what process waters¹ are added to or deleted from the list; f) by what selection criteria listed waters are placed on the list; g) how waters on the list are prioritized for TMDLs; and h) how interstate/international disagreements concerning the list are resolved.

Placement of Waters within the Five Categories in the new EPA CALM guidance.

40 CFR, Part 130.7 requires all waters on 303d lists subsequent to the 2000 list, to be partitioned into four parts. New guidance issued by EPA in 2003 supersedes this original guidance. Beginning with the 2004 assessment cycle, the department will follow this new guidance and list all the classified waters of the state in one of these five categories.

Category 1

All designated beneficial uses are fully maintained. Data or other information supporting full beneficial use attainment for all designated beneficial uses must be consistent with the state listing methodology document. The department will place a water in Category One if both of the following conditions are met:

¹ Waters are “Waters of the State” as defined in the Missouri Clean Water Law 644 RSMO.

- The water has chemical and/or biological water quality data that indicate attainment with all designated uses, or the watershed of this water has geology and land use similar to a water that does have water quality data that indicate attainment with all designated uses, and
- The mean (arithmetic average) level of mercury in fillets of higher trophic level fish (bass, walleye, sauger and pike) is 0.3 mg/kg or less.

Category 2

One or more designated beneficial uses are fully attained but at least one designated beneficial use has inadequate data or information to make a use attainment decision consistent with the state listing methodology document. The department will place a water in Category Two if all of the following conditions are met:

- Chemical and/or biological water quality data do not indicate impairment of any beneficial uses.
- Chemical and/or biological water quality data that indicate attainment with some but not all designated uses, or the watershed of this water has geology and land use similar to a water that has water quality data that indicates attainment with some but not all designated uses.
- Insufficient fish fillet tissue data is available in this water for mercury in higher trophic level fish.

Category 3

None of the designated beneficial uses have adequate data or information to make a use attainment decision consistent with the state listing methodology document.

Category 3A. The department will place a water in Category 3A if the following conditions are met:

- The water is currently not assessed for attainment of any of its designated uses due to the lack of water quality data for this water or for a water whose watershed has similar geology and land use.

Category 3B. The department will place a water in Category 3B if the following conditions are met:

- Available data suggests one or more beneficial uses may be impaired but more data is needed to meet listing methodology document data requirements.

Category 4

One or more designated beneficial uses are not attained, but a TMDL is not required.

Category 4A

EPA has approved a TMDL that addresses the impairment. The department will place a water in Category 4A if both the following conditions are met:

- Any portion of the water is rated as non-attainment for at least one designated beneficial use due to one or more discrete pollutants or discrete properties of water², and
- USEPA has approved a TMDL for all pollutants causing that non-attainment.

Category 4B

Water pollution controls required by a local, state or federal authority, are expected to correct the impairment in a reasonable period of time. The department will place a water in Category 4B if both of the following conditions are met:

- Non-attainment of beneficial use due to one or more discrete pollutants or discrete properties of water, and
- A water quality based permit that addresses the pollutant(s) causing the designated use impairment has been issued or is expected to be issued within the assessment cycle. Or other pollution control requirements have been made or will be made during the assessment cycle that are expected to adequately address the pollutant(s) causing the impairment.

Category 4C

A discrete pollutant(s) or other discrete property of the water does not cause the impairment. The department will place a water in Category 4C if both of the following conditions are met:

- Any portion of the water is rated as being in non-attainment for at least one designated beneficial use, and
- The only cause(s) of the non-attainment is not a specific chemical element (ie manganese, lead, zinc) chemical compound (ie, ammonia, dieldrin, atrazine) or one of the following quantifiable physical, biological or bacteriological conditions: water temperature, percent of gas saturation, amount of dissolved oxygen, pH, deposited sediment, suspended sediment, turbidity, toxicity or density of fecal coliform or E. coli bacteria.

Category 5

At least one discrete pollutant has caused at least one designated beneficial use to be judged in non-attainment consistent with the state listing methodology and the water does not meet the criteria for either category 4A or 4B. Category 5 waters are the state 303(d) listed waters. The department will place a water in Category 5 if both the following conditions are met:

² A discrete pollutant or a discrete property of water is defined here as a specific chemical or other attribute of the water (such as temperature, dissolved oxygen or pH) that causes beneficial use impairment and that can be measured quantitatively.

- Any portion of the water is rated as non-attainment for at least one designated beneficial use due to one or more discrete pollutants or discrete property of the water, and
- That portion of the water is not listed in Category 4A or 4B.

II. The Methodology Document

A. Procedures and Methods Used to Collect Water Quality Data

MDNR Monitoring

The major purposes of the Department of Natural Resources' water quality monitoring program are (1) to characterize background or reference water quality conditions; (2) to better understand daily, flow event, and seasonal water quality variations and their underlying processes; (3) to characterize aquatic biological communities (4) to assess time trends in water quality; (5) to characterize local and regional impacts of point and nonpoint source discharges on water quality; (6) to check for compliance with water quality standards or wastewater permit limit and; (7) to support development of strategies, including TMDLs, to return impaired waters to compliance with water quality standards. All of these objectives are statewide in scope.

Coordination with Other Monitoring Efforts in Missouri

The Department of Natural Resources cooperates with other agencies in performing special water quality studies.

In 1998, a multi-agency monitoring task force including the Missouri Department of Natural Resources, the Missouri Department of Conservation, the U.S. Environmental Protection Agency, the U.S. Geological Survey, the U.S. Forest Service, the USDA Natural Resources Conservation Service and the University of Missouri convened. The goals of this group were to outline a statewide aquatic resources monitoring plan, define partnership roles in this monitoring plan and to discuss the kind of research needed to further this new monitoring effort. A review of the entire Water Pollution Control Program monitoring plan by USEPA began in June 2003. Several state and federal agencies will participate in this review.

To maximize efficiency, the department routinely coordinates its monitoring activities to avoid overlap with other agencies and provide and receive interagency input on monitoring study design. Data from other sources is used for meeting the same objectives as department sponsored monitoring. The agencies most often involved are the U.S. Geological Survey (USGS), the U.S. Army Corps of Engineers, the U.S. Environmental Protection Agency (EPA), the Missouri Department of Conservation (MDC), the USDA/Agricultural Research Service (ARS) and the Missouri Department of Health and Senior Services. However, the department also tracks the monitoring efforts of the National Park Service, the U.S. Forest Service, several of the state's larger cities, the states of Oklahoma, Arkansas, Kansas, Iowa and Illinois and graduate level research conducted at universities within Missouri. The department also uses monitoring data acquired by wastewater dischargers as a condition of discharge permits issued by the department. In 1995, the department began using data collected by volunteers that have passed Quality Assurance/Quality Control (QA/QC) tests.

Existing Monitoring Networks and Programs

The following is a list description of the kinds of water quality monitoring activities presently occurring in Missouri.

1. Fixed Station Network

- A. Objective: To better characterize background or reference water quality conditions, to better understand daily, flow event and seasonal water quality variations and their underlying processes, to assess time trends and to check for compliance with water quality standards.
- B. Design Methodology: Sites were chosen based on one of the following criteria:
 - site is believed to have water quality representative of many neighboring streams of similar size due to similarity in watershed geology, hydrology and land use, and the absence of any impact from a local point or discrete nonpoint water pollution source.
 - site is downstream of a significant point source or localized nonpoint source area.
- C. Number of Sites, Sampling Methods, Sampling Frequency, Parameters:
 - USGS/DNR cooperative network: 57 sites statewide, horizontal and vertical integrated grab samples, 6-12 times per year for major ions, nutrient ions, temperature, pH, dissolved oxygen, specific conductance and flow, 2-4 times annually for suspended solids and heavy metals, and for pesticides 6 times annually at 6 sites.
 - Crowder College network: 8 sites in southwest Missouri, grab samples 18 times per year for pH, conductance, temperature, total phosphorus, ammonia nitrogen, nitrate plus nitrite, nitrogen, fecal coliform and fecal strep bacteria.
 - DNR raw water sampling of public drinking water reservoirs: nine drinking water reservoirs are sampled 4 times/year for some commonly used agricultural herbicides.
 - UMC/DNR lake monitoring network. This program has monitored about 110 lakes. About fifty-five to sixty lakes are monitored each year. Each lake is usually sampled four times during the summer and about 12 are monitored spring through fall for nutrients, chlorophyll, turbidity and suspended solids.
 - DNR routine monitoring of finished public drinking water supplies for bacteria and trace contaminants.
 - Routine bacterial monitoring (typically weekly during the summer) of swimming beaches at Missouri state parks during the recreational season by DNR, Division of State Parks.
 - Monitoring of sediment quality by DNR at approximately ten discretionary sites annually. All sites are monitored for several heavy metals and organic contaminants. A pore water sample is analyzed for ammonia and a Microtox toxicity test is performed on the sediment.

2. Special Water Quality Studies

- A. Objective: Special water quality studies are used to characterize the water quality impacts from a specific pollutant source area.
- B. Design Methodology: These studies are designed to determine the contaminants of

concern based on previous water quality studies, effluent sampling and/or Missouri State Operating Permit applications. These studies employ multiple sampling stations downstream and upstream (if appropriate). If contaminants of concern have significant seasonal or daily variation, season of the year and time of day variation must be accounted for in the sampling design.

- C. Number of Sites, Sampling Methods, Sampling Frequency, Parameters: The Missouri Department of Natural Resources conducts or contracts for 10-15 special studies annually. Each study has multiple sampling sites. Number of sites, sampling frequency and parameters all vary greatly depending on the study. Intensive studies would also require multiple samples per site over a relatively short time frame.

3. Toxics Monitoring Program

The fixed station network and many of our intensive studies monitor for toxic chemicals. In addition, major municipal and industrial dischargers must monitor for toxicity in their effluents as a condition of their Missouri State Operating Permits.

4. Biological Monitoring Program

- A. Objectives: The objectives of this program are to develop numeric criteria describing “reference” aquatic macroinvertebrate and fish communities in Missouri’s streams, to implement these criteria within state water quality standards and to continue a statewide fish and aquatic invertebrate monitoring program
- B. Design Methodology: Development of biocriteria for invertebrates and fish involves identification of streams divided among Missouri’s aquatic ecoregions. It also includes intensive sampling of invertebrate and fish communities to quantify temporal and spatial variation in reference streams within ecoregions and variation between ecoregions, and the sampling of chemically and physically impaired streams to test sensitivity of various community metrics to differences in stream quality.
- C. Number of Sites, Sampling Methods, Sampling Frequency, Parameters: The department has conducted biological sampling of aquatic invertebrates for many years. Since 1991 this program has consisted of standardized monitoring of approximately 55 sites twice annually. The Missouri Department of Conservation presently has a statewide fish and aquatic invertebrate monitoring program designed to assess and monitor the health of Missouri’s stream resources. This program samples a minimum of 450 random and 30 reference sites every five years.

5. Fish Tissue

- A. Objective: Fish tissue monitoring can address two separate objectives. These are 1) the assessment of ecological health or the health of aquatic biota (usually accomplished by monitoring whole fish samples) and 2) the assessment of human health risk based on the level of contamination of fish fillets.

B. Design Methodology. Fish tissue monitoring sites were chosen based on one of the following criteria:

- site is believed to have water and sediment quality representative of many neighboring streams of similar size due to similarity in geology, hydrology and land use, and the absence of any known impact from a local point source or discrete nonpoint water pollution source.
- site is downstream of a significant point source or localized nonpoint source area.

C. Number of Sites, Sampling Methods, Sampling Frequency, Parameters:

Missouri DNR and USEPA have a cooperative fish tissue monitoring program that collects whole fish composite samples³ at approximately 12 fixed sites. Each site is sampled once every two years. The preferred species for these sites are either carp or redhorse sucker. This program also samples approximately five discretionary sites annually for two fish fillet composite samples. One sample is of a top carnivore fish such as largemouth bass, smallmouth bass, walleye or sauger. The other sample is for a species of a lower trophic order such as catfish, carp or sucker.

The Missouri Department of Conservation samples approximately 50 discretionary sites annually for fish fillets. They sample a wide variety of species. Both of these monitoring programs analyze for several chlorinated hydrocarbon insecticides, PCBs, lead, cadmium, mercury and fat content.

6. Volunteer Monitoring Program

Two volunteer monitoring programs are now generating water quality data in Missouri. The first is a cooperative program between the Department of Natural Resources, the University of Missouri and volunteers that monitors approximately 16 lakes, including Lake Taneycomo, Table Rock Lake and several lakes in the Kansas City area. Data from this program is used by the University as part of a long-term study on the limnology of midwestern reservoirs.

The second program involves volunteers who monitor water quality of streams throughout Missouri. The Volunteer Water Quality Monitoring Program is a cooperative project of the Department of Natural Resources, the Department of Conservation and the Conservation Federation of Missouri. By the end of 2003, just over 3000 citizen volunteers had attended at least one training workshop. After the introductory class, many proceed on to at least one more class of higher level training; Levels 1,2,3 and 4. Each level of training is a prerequisite for the next higher level, as is appropriate data submission. Levels 2, 3 and the newest Level, 4 (piloted in 2003) represent increasingly higher quality assurance. Of those completing an introductory course, 383 (about 13%) proceed to Levels 1 and 2. Seventy-two volunteers have reached Level 3.

Laboratory Analytical Support

Laboratories used:

- USGS/DNR Cooperative Fixed Station Network: USGS Lab, Denver, Colorado
- Crowder College Network: Crowder College, Neosho, Missouri

³ A composite sample is one in which several individual fish are combined to produce one sample.

- DNR Public Drinking Water Reservoir Network: Missouri DNR Environmental Lab
- Intensive Surveys: Varies, many are done by Missouri DNR Environmental Lab
- Toxicity Testing of Effluents: many commercial labs
- Biological Criteria for Aquatic Invertebrates: Missouri DNR Environmental Lab and University of Missouri, Columbia
- Fish Tissue: USEPA Region VII Lab, Kansas City, Kansas and Miscellaneous contract labs (Missouri Department of Conservation)
- Missouri State Operating Permit: self-monitoring or commercial labs
- DNR Public Drinking Water Monitoring: Missouri DNR and commercial labs
- Agricultural Research Service: ARS lab
- Other water quality studies: many commercial labs

B. Identification of All Existing and Readily Available Water Quality Data Sources

Data sources that may be directly used⁴ to assess water quality conditions in Missouri and to aid in the compilation of the Section 303(d) list include but are not limited to:

1. Fixed station water quality and sediment data collected and analyzed by Missouri DNR personnel in the Missouri DNR Lab.
2. Fixed station water quality data collected by the U.S. Geological Survey and Crowder College under contractual agreements with Missouri DNR.
3. Fixed station water quality data collected by the U.S. Geological Survey under contractual agreements to agencies or organizations other than Missouri DNR.
4. Fixed station water quality, sediment quality and aquatic biological information collected by the U.S. Geological Survey under their NASQAN and NAWQA monitoring programs.
5. Fixed station raw water quality data collected by the Kansas City Water Services Department, the St. Louis City Water Company, St. Louis County Water Company, Springfield City Utilities and Springfield Department of Public Works.
6. Fixed station water quality data collected by the U.S. Army Corps of Engineers, the Arkansas Department of Pollution Control and Ecology, the Kansas Department of Health and Environment and the Iowa Department of Natural Resources.
7. Fixed station water quality monitoring by corporations.
8. Annual fish tissue monitoring programs by USEPA/Missouri Department of Natural Resources (RAFTMP program) and the Missouri Department of Conservation.
9. Special Water Quality Surveys conducted by Missouri Department of Natural Resources. Most of these surveys are focused on the water quality impacts of specific point source wastewater discharges. Some surveys are of well-delimited nonpoint sources such as abandoned mined lands. These surveys often include physical habitat evaluation and monitoring of aquatic invertebrates as well as water chemistry monitoring.
10. Special Water Quality Surveys conducted by the U.S. Geological Survey, including but not limited to:
 - a) geological, hydrological and water quality of various hazardous waste sites
 - b) geological, hydrological and water quality of various abandoned mining areas
 - c) hydrology and water quality of urban nonpoint source runoff in St. Louis, Kansas City and Springfield, Missouri
 - d) Bacterial and nutrient contamination of streams in southern Missouri
11. Special water quality studies by other agencies such as the Missouri Department of Conservation, the U.S. Public Health Service, and the Missouri Department of Health and

⁴ See table 1 for specific data requirements.

Senior Services.

12. Monitoring of fish occurrence and distribution in by the Department of Conservation.
13. Fish Kill and Water Pollution Investigations Reports published by the Missouri Department of Conservation.
14. Selected graduate research projects pertaining to water quality and/or aquatic biology.
15. Water quality, sediment and aquatic biological data collected by the department, USEPA or their contractors at hazardous waste sites in Missouri.
16. Self-monitoring of wastewaters and receiving streams by cities, sewer districts and industries that have significant wastewater discharges. This monitoring includes chemical and sometimes toxicity monitoring of some of the larger wastewater discharges, particularly those that discharge to smaller streams and have the greatest potential to affect instream water quality.
17. Compliance monitoring of wastewaters and receiving waters by the Missouri Department of Natural Resources and USEPA. This can include chemical and toxicity monitoring.
18. Bacterial monitoring of streams and lakes by county health departments, community lake associations and other organizations using acceptable analytical methods.
19. Other monitoring activities done under a quality assurance project plan approved by the department.

Data sources that may be used to direct additional monitoring that would allow a water quality assessment for Section 303(d) listing purposes.

20. Fixed station water quality and aquatic invertebrate monitoring by volunteers who have successfully completed the Volunteer Monitoring Program Level Two workshops.⁵
21. Fish Management Basin Plans published by the Missouri Department of Conservation.
22. Fish Consumption Advisories published annually by the Missouri Department of Health and Senior Services.

C. Data Quality Considerations

Quality Assurance/Quality Control Programs

1. Missouri Department of Natural Resources Quality Assurance/Quality Control Program

Missouri DNR and USEPA Region VII have completed a Total Quality Management Plan. All environmental data generated directly by the department or through contracts funded by the department or EPA require a Quality Assurance Project Plan (QAPP). The agency or organization responsible for collection or collection and analysis of the environmental sampling must write and adhere to a QAPP approved through the Missouri Department of Natural Resources' Quality Management Plan. Data sources 1, 2, 9, 15, 17 and 19 are wholly covered under the Missouri Department of Natural Resources approved QAPP. Those parts of sources 8, 10, 11, 14 and 18 funded by the Missouri Department of Natural Resources or USEPA Region VII are also covered under Missouri Department of Natural Resources approved QAPP.

2. Other Quality Assurance/Quality Control Programs

Sources 2, 3, 4 and 10 are all covered under a U.S. Geological Survey internal quality

⁵ Data collected by volunteers that have successfully completed the Level Two workshop is considered to be of Data Quality Code Level One.

assurance program that has been reviewed and approved by Missouri Department of Natural Resources.

Water quality data from any source will be judged as “scientifically defensible” if the data was generated under an internal quality assurance/quality control program approved by the department. Data generated in the absence of a department approved quality assurance/quality control program may be used to determine the 303(d) status of a water. To use this data, the department must determine that the data is scientifically defensible after making a review of the quality assurance procedures used by the data generator.

Other Data Quality Considerations

1. Data Age

For assessing present conditions, more recent data is preferable but older data can be used to assess present conditions if the data remains representative of present conditions. If the department uses data to make a 303(d) listing decision that predates the date the list is developed by more than seven years, the department will provide a written justification for the use of such data. A second consideration is the age of the data relative to significant events that may have an effect on water quality. Data collected prior to the initiation of a new significant wastewater discharge, a large spill event, the major upgrade of an existing wastewater treatment facility or the reclamation of mining or hazardous waste site, for example, is not representative of present conditions. Such data would not be used to assess present conditions even if it was less than seven years old. Such “pre-event” data can be used to determine changes in water quality before and after the “event” or to show water quality time trends.

2. Data Type, Amount and Information Content

The USEPA recommends establishing a data quality code and rating data quality by the kind and amount of data present at a particular location (USEPA 1997⁶). The code is a single digit number from one to four, indicating the degree of assurance the user has in the accuracy of a particular environmental data set. Level One indicates the least assurance and Level Four the greatest. Based on EPA’s guidance, the Missouri Department of Natural Resources uses the following rules to assign quality codes to data.

Level One: - All data not meeting the requirements of Levels Two, Three or Four.

Level Two: - Chemical data collected quarterly to bimonthly for at least three years or intensive studies that monitor several nearby sites repeatedly over short periods of time or
- At least three fish tissue samples per waterbody.

Level Three: - Chemical data collected at least monthly for more than three years and providing data on a variety of water quality constituents including heavy metals and pesticides; or

⁶ ibid Tables 3-1 through 3-4.

- Quantitative biological monitoring of at least one aquatic assemblage (fish, invertebrates or algae) at multiple sites.

Level Four: - Chemical data collected at least monthly for more than three years and providing data on a variety of water quality constituents including heavy metals and pesticides, and including chemical sampling of sediments and fish tissue; or
 - Quantitative biological monitoring of at least two aquatic assemblages (fish, invertebrates or algae) at multiple sites.

In Missouri, the primary purpose of Level One data is to provide a rapid and inexpensive method of screening large numbers of waters for obvious water quality problems and to determine where more intensive monitoring is needed. In the preparation of the state 305(b) report, data from all four data quality levels are used. Most of the data is of Level One quality, and without Level One data staff would not be able to assess a majority of the state's waters.

In general, when selecting waterbodies for the Missouri 303(d) list, only Level Two or higher data are used, unless the problem can be accurately characterized by Level One data.⁷ The reason is that Level Two data provides a higher level of assurance that a water quality standard is actually being exceeded and that a TMDL study is necessary. All waterbodies placed in Category 3B receive high priority for additional monitoring so that data quality is upgraded to at least Level Two.

D. How Water Quality Data is Evaluated to Determine Whether or Not Waters are Impaired for 303(d) Listing Purposes

Physical, Chemical, Biological and Toxicity Data

USEPA provides guidelines to the states on how to evaluate water quality data in order to determine if waters are impaired (USEPA 2003⁸). These guidelines are used by the department to write the state 305(b) report and to develop the 303(d) list. The guidelines shown in Table 1 below are those used to make Section 303(d) listing decisions.

⁷ When a listing, amendment or de-listing of a 303(d) water is made with only Level One data, a document will be prepared that includes a display of all data and a presentation of all statistical tests or other evaluative techniques that documents the scientific defensibility of the data.

⁸ Guidance for 2004 Assessment, Listing and Reporting Requirements Pursuant to Sections 303(d) and 305(b) of the Clean Water Act.

Table 1. METHODS FOR ASSESSING COMPLIANCE WITH
WATER QUALITY STANDARDS USED FOR 303(d) LISTING PURPOSES

BENEFICIAL USES	DATA TYPE	DATA QUALITY CODE	COMPLIANCE WITH WATER QUALITY STANDARDS
Overall use protection (all beneficial uses)	No data--evaluated based on similar land use/ geology as stream with water quality data. ⁹		Given same rating as monitored stream with same land use and geology.
Overall use protection (all beneficial uses)	Narrative criteria for which quantifiable measurements can be made.	1	<p><u>Full</u>: Stream appearance typical of reference streams in this region of the state.</p> <p><u>Non-Attainment</u>: Presence of objectionable or unsightly color, odor, turbidity, bottom deposits, oil, scum, floating or suspended debris, or the presence of substances in sufficient amounts to prevent full maintenance of beneficial uses. For the purposes of 303(d) listing; a waterbody will be considered to be not in conformance with narrative water quality criteria if these quantifiable limits are exceeded.</p> <p>Color: color as measured by the Platinum-Cobalt visual method (SM 2120 B) in a water is statistically significantly higher than a control water.</p> <p>Objectionable Bottom Deposits: the affected stream segment must be at least 100 yards in length, and for all areas within this affected segment that have a flow velocity less than 0.5 feet/second at the time the stream is evaluated, greater than 10% of the stream bottom is covered by sewage sludge, trash or other materials reaching the water due to anthropogenic sources.</p>
Protection of Aquatic Life	Quantitative Sampling of One aquatic assemblage (fish, macroinvertebrates or algae) at one site.	1 ⁷	<p><u>Full</u>: Aquatic assemblage typical of reference streams, or other appropriate control streams in this region of the state.</p> <p><u>Non-Attainment</u>: Aquatic assemblage has statistically significant alteration of the composition or reduction in diversity in comparison to reference streams or other appropriate control streams in this region of the state.</p>

⁹ This data type is used only for wide-scale assessments of aquatic biota and aquatic habitat for 305(b) report purposes. This data type is not used in the development of the 303(d) list.

BENEFICIAL USES	DATA TYPE	DATA QUALITY CODE	COMPLIANCE WITH WATER QUALITY STANDARDS
Protection of Aquatic Life	Toxic Chemicals	1-4	<u>Full</u> : No more than 1 exceedence of acute criterion in 3 years; 10% or fewer of all samples exceed chronic criterion- <u>Non-Attainment</u> : More than 1 exceedence of acute criterion in 3 years. More than 10% of all samples exceed chronic criterion.
Protection of Aquatic Life	Conventional (pH, temperature, dissolved oxygen, total dissolved gases, oil and grease, sulfate plus chloride)	1-4	<u>Full</u> : No more than 10% of all samples exceed criterion ¹⁰ . <u>Non-Attainment</u> : Requirements for full attainment not met.
Protection of Aquatic Life	Biological	3-4	<u>Full</u> : Fauna very similar to regional reference streams. If DNR wadeable streams macroinvertebrate sampling and evaluation protocols are followed, for seven or fewer samples, at least 75% of the stream condition index scores must be 16 or greater. For greater than seven samples or for other sampling and evaluation protocols, results must be statistically similar to representative reference or control streams. <u>Non-Attainment</u> : If DNR wadeable streams macroinvertebrate sampling and evaluation protocols are followed, for seven or fewer samples, at least 75% of the stream condition index scores must be 14 or lower. For more than seven samples or for other sampling and evaluation protocols, results must be statistically dissimilar to representative reference or control streams.
Protection of Aquatic Life	Toxicity testing of streams or lakes	2	<u>Full</u> : No more than one test result of statistically significant deviation from controls in acute test in a 3-year period. No more than 10% of chronic tests result in statistically significant deviation from controls. <u>Non-Attainment</u> : Requirements for full attainment not met.
Fish Consumption	Chemicals (water)	1-4	<u>Full</u> : Water quality criteria not exceeded as an average. ¹⁰ <u>Non-Attainment</u> : Requirements for full attainment not met.
Fish Consumption	Chemicals (tissue)	1-2	<u>Full</u> : Fish tissue guidelines ¹¹ not exceeded as average ¹² . <u>Non-Attainment</u> : Requirements for full attainment not met.

¹⁰ The time period used to calculate the average will be the entire period that is judged to be representative of present conditions. See section on Data Age.

¹¹ Fish tissue threshold levels are Chlordane 0.1 mg/kg (Crellin, J.R. 1989, "New Trigger Levels for Chlordane in Fish-Revised Memo" Mo. Dept. of Health interoffice memorandum. June 16, 1989), Mercury 0.3 mg/kg (based on two documents: Mercury Levels in Commercial Fish and Shellfish- <http://www.cfsan.fda.gov/~frf/sea-mehg.html> and FDA and EPA Announce the Revised Consumer Advisory on Methylmercury in Fish-

BENEFICIAL USES	DATA TYPE	DATA QUALITY CODE	COMPLIANCE WITH WATER QUALITY STANDARDS
Drinking Water Supply ¹³ (raw water)	Chemical (toxics)	1-4	<u>Full</u> : Average values do not exceed water quality standard. ¹² <u>Non-Attainment</u> : Requirements for full attainment not met.
Drinking Water Supply- Raw Water ¹³	Chemical (Iron, Manganese, Total Dissolved Solids)	1-4	<u>Full</u> : Average value does not exceed water quality standard. ¹⁰ <u>Non-Attainment</u> : Requirements for full attainment not met.
Drinking Water Supply- Finished Water	Chemical (toxics)	1-4	<u>Full</u> : No MCL* violations based on SDWA data evaluation procedures. <u>Non-Attainment</u> : Requirements for full attainment not met. NOTE: Finished water data will not be used for analytes where water quality problems may be caused by the drinking water treatment process such as the formation of Trihalomethanes (THMs), or problems that may be caused by the distribution system (bacteria, lead, copper).
Whole-Body-Contact Recreation	Fecal Coliform or E. coli count	1-4	<u>Full</u> : Water Quality Standards not exceeded as a geometric mean for samples collected during seasons and flow conditions for which bacteria criteria apply. <u>Non-Attainment</u> : Requirements for full attainment not met.
Irrigation, Livestock and Wildlife Water	Chemical	1-4	<u>Full</u> : Average value does not exceed water quality criteria. ¹⁰ <u>Non-Attainment</u> : Requirements for full attainment not met. ¹⁰

** MCL= Maximum Contaminant Level, the maximum level allowed for a chemical in finished drinking water.

Other Types of Information

1. Observation and evaluation of waters for noncompliance with state narrative water quality criteria. These narrative criteria apply to both classified and unclassified waters and prohibit the following in waters of the state. Missouri's narrative water quality criteria as described in

<http://www.fda.gov/bbs/topics/news/2004/NEW01038.html>), PCBs 2.0 mg/kg (USFDA Industries Activities Staff Booklet, August 2000 (<http://vm.cfsan.fda.gov/~lrd/daact.html>) , and Lead 0.3 mg/kg (World Health Organization 1972. "Evaluation of Certain Food Additives and the Contaminants Mercury, Lead and Cadmium". WHO Technical Report Series No. 505, Sixteenth Report on the Joint FAO/WHO Expert Committee on Food Additives. Geneva 33 pp.

¹² The length of the averaging period is equal to the length of the exposure period in the risk assessment used to develop the tissue criterion for that chemical.

¹³ Raw water samples used for compliance with source water criteria must be taken at a depth no deeper than the depth of the drinking water intake.

10 CSR 20-7.031, Section (3) may be used to evaluate waters when a quantitative value can be applied to the pollutant.

- a. unsightly, putrescent or harmful bottom deposits
- b. oil, scum and floating debris
- c. unsightly turbidity or odor
- d. substances causing toxicity to human, animal or aquatic life
- e. human health hazard due to incidental contact
- f. acute toxicity to livestock or wildlife when used as a drinking water supply
- g. physical, chemical or hydrologic changes that impair the natural biological community
- h. used tires, car bodies, appliances, demolition debris, used vehicles or equipment and any solid waste as defined by Missouri's Solid Waste Law

2. Habitat Assessments. Habitat assessment protocols for wadeable streams have been established and are made in conjunction with sampling of aquatic invertebrates and the analysis of aquatic invertebrates data. Missouri Department of Natural Resources will not use habitat assessment data alone for assessment purposes.

E. 303(d) Listing Considerations

1. Adding to the Existing List or Expanding the Scope of Impairment to a Previously Listed Water

New waters are added to the list following EPA guidelines in Section 1B and data evaluation rules in Table 1. Likewise, the listed portion of an impaired water can be increased based on recent monitoring data following the same guidelines. Likewise one or more new pollutants can be added to the listing for a water already on the list based on recent monitoring data following the same guidelines.

2. Deleting from the Existing List or Decreasing the Scope of Impairment to a Previously Listed Water.

Waters are deleted from the list following EPA guidelines in Section 1B and data evaluation rules in Table 1. Likewise, the listed portion of an impaired water can be decreased based on recent monitoring data following these same guidelines. Likewise, one or more pollutants can be deleted from the listing for a water already on the list based on recent monitoring data following these same guidelines.

3. Prioritization of Waters for TMDL Development

Within the first paragraph of section 303(d), the statute requires a priority rating for the creation of TMDLs for listed waters, taking into account the severity of the pollution and the uses to be made of such waters. The following four criteria describe how priorities among the Section 303(d) waters are selected:

1. Waters with human health use impairment, or more than one use impairment rate as high priority pending application of Criterion 4.
2. Waters with a single use impairment other than a human health use or an aesthetic use rate as medium priority pending application of Criterion 4.

3. Waters with only an aesthetic use impairment rate as low priority.
4. If a water initially rated as medium priority is impaired by a source that is judged to be highly treatable, it is rated high priority. If water initially rated as high priority is impaired by a source that is judged to be impractical to treat, it is rated as medium priority.

With regard to the number of beneficial uses impaired, all classified waters in Missouri are protected for at least three beneficial uses: livestock and wildlife watering, protection of aquatic life and human consumption of fish. In addition, some waters are protected for other uses if those uses are expected of particular waters. These other uses include drinking water supply, irrigation, and whole body contact recreation (swimming, water skiing).

With regard to treatability of the impairment, some water quality problems are more amenable to being successfully treated than others. In addition, some problems are inherently more expensive to treat than others and some problems have economic impacts only at a very local scale while others will affect regional economies. Last, some water quality problems can be treated with economic consequences only, but for others there will be environmental trade-offs as well.

Examples of Prioritization of Selected Waters:

Water	Priority	Criteria
Big River	High	Fish consumption advisory for lead (human health), sediment deposition also affects aq. life (multiple use impairments). Reclamation of abandoned tailings piles would be effective in correcting this problem (highly treatable).
Dog Creek	High	Aquatic life use impairment (one use), problem could be effectively treated by improved stormwater controls at limestone quarry.
Sugar Creek	Medium	Aquatic life use impairment (one use), subsurface acid mine drainage would be very difficult to treat.
S. Wyaconda River	Low	Only impairment is of an aesthetic water quality standard.

4. Resolution of Interstate/International Disagreements

The Missouri Department of Natural Resources will review the draft 303(d) lists of all other states with which we share border waters (Missouri River, Mississippi River, Des Moines River and the St. Francis River). Where the listing in another state is different than in Missouri, the department will request the data upon which the listing in the other state is based. These data will be reviewed following all data evaluation guidelines previously discussed in this document and the Missouri list will or will not be changed pending the evaluation of this additional data.

For waters which cross the Missouri state line going to or coming from another state, when the 303(d) listing changes at the state line, the Missouri Department of Natural Resources

will, upon request of the bordering state, USEPA or other interested party, review and evaluate data supplied from the other state. These data will be reviewed following all data evaluation guidelines previously discussed in this document and the Missouri list will or will not be changed pending the evaluation of this additional data.
